Frequency vs. Temperature Characteristics

To calculate the frequency stability the parabolic curvature constant (K) is needed.
For calculating the stability at 45°C?

1- Change in temperature (ΔT) is (45-25) = +20°C

2- Change in frequency is $(-0.034 \times (\Delta^{\circ}\text{C})^2) = (-0.035 \times (20)^2) = -13.6\text{ppm}$
