Zero Cross Detection Output

In many applications it is advantageous to synchronize various events to the mains frequency and phase. For example, the efficiency of power Thyristor circuits is increased and component service life is extended, e.g. for relays, if switching occurs at zero-crossing. In addition, sensing applications like those frequently found in the 'Smart Home' market, need to eliminate 50/60 Hz noise, which can be easily accomplished by synchronizing built-in A/D converters with the mains frequency.

Phase Shift

Phase shift: When input AC signal crossing with X axis, the output zero crossing detection signal pulse reversal, the delta-T between the two signal. Where: a. Pulse rising edge shift @ VAC=0 : AC Signal from 0 voltage to max value. Here is T1. b. Pulse dropping edge shift @ VAC=0 : Signal from max value to 0 Voltage. Here is T2
