Power Module

- Wide input range (3 - 18V)
- Low profile 1.45mm
- Small footprint 3x3mm
- Adjustable output 0.8 to 5.2V
- Up to 120°C ambient temperature with derating
- Integrated solution

RPL-3.0

3.0 Amp
10 Pad LGA
Package

EN55032 compliant

Description

The RPL-3.0 is a buck converter with integrated inductor in a tiny 3mm x 3mm x 1.45mm thermally-enhanced LGA package. The input range is from 3.0 to 18VDC, allowing 5V and 12V supply rails to be used. The output voltage can be set with two resistors in the range from 0.8V up to 5.2V. The output current is up to 3A and is fully protected against continuous short-circuits, output overcurrent or over-temperature faults. Its high current and small size make the RPL-3.0 ideal for imaging systems, distributed power architectures, portable equipment in telecom as well as industrial applications.

Selection Guide

V_{CC} load regulation		$I_{CC} = 20\text{mA}$		3%	
Rise time		V_{OUT} from 10% to 90%		1.65ms	

Typical Application

$V_{IN} = 4\text{--}18\text{VDC}$; $V_{OUT} = 3.3\text{VDC}$, $I_{OUT} = 3\text{A}$

Notes:

Note5: A 10 μF input capacitor (C_{IN}) is required to absorb the input switching current. A 22 μF output capacitor (C_{OUT}) is mandatory.

To get stable regulation use for R_1 and R_2 1% or 0.1% resistors, R_s should be 1k Ω m.

RECOM recommends low ESR X5R or X7R ceramic caps.

OUTPUT VOLTAGE SETTING

The external resistor divider sets the output voltage. Choose the R1 resistance. R2 can be estimated with Equation:

$$R2 = \frac{R1}{\frac{V_{OUT}}{0.8VDC} - 1}$$

Where V_{OUT} is the output voltage. The output voltage feedback gain is determined by:

$$G_{FB} = \frac{R2}{R1 + R2}$$

To stabilize the system and optimize the load transient response, place a feed-forward capacitor (C_{FF}) in parallel with R1. Upper table shows the values of feedback resistors and feed-forward capacitors for common output voltages.

Table below lists recommended resistor values for common Vout:

V_{OUT} [V]	R1 [k Ω]	R2 [k Ω]	C_{FF} [pF]	C_{OUT} [pF]
1	47	187	22	22
1.2	47	93.1	22	22
1.5	47	53.6	22	22
1.8	47	37.4	22	22
2.5	47	22	39	22
3.3	47	15	39	22
5	47	8.87	39	22

Pad Information

Pad #	Function	Description
1	CTRL	CTRL pin. Connect to +Vin when not used.
2	+VIN	Input voltage. Connect using wide PCB traces. Requires Cin to decouple input rail.
3, 4	-VIN	System ground. Reference ground of the regulated output voltage. Requires special consideration during PCB layout. Connect to -VIN with copper traces and vias.
5	VOUT	Output voltage. Connect external bypass capacitors between this pin and GND close to the pins.
6	+Sense	Output voltage sense pin
7	FB	Feedback input. Used to set the output voltage between 0.8V and 5.2V
8	GND	Analog ground
9	VCC	Internal 3.3VDC LDO regulator output.
10	PG	Power good output.

- 1 Pb-Free assembly is recommended according to JEDEC J-STD020.
- 2 Ensure that the peak reflow temperature does not exceed 240°C ±5°C as per JEDEC J-STD020
- 3 The reflow time period during peak temperature of 240°C ±5°C should not exceed 30 seconds.
- 4 Reflow time above liquidus (217°C) should not exceed 150 seconds.
- 5 For solder paste use a standard SAC Alloy such as SAC 305, type 3 or higher.
- 6 Other soldering methods (e.g. vaporphase) are not verified and have to be validated at his own risk.

PCB LAYOUT SUGGESTION

Efficient PCB layout is critical for stable operation. For the best results, see Figure below and follow the guidelines below:

1. Keep the connection of the input ground and -V_{IN} as short and wide as possible.
2. Ensure that all feedback connections are short and direct.
3. Place the feedback resistors as close to the chip as possible.
4. Route sensitive analog areas such as FB away from SW.
5. Place enough vias around the chip to improve thermal performance.
