

High Performance 6-Axis MotionTracking™ IMU

ICM-42670-P HIGHLIGHTS

The ICM-42670-P is a high performance 6-axis MEMS MotionTracking device that combines a 3-axis gyroscope and a 3-axis accelerometer. It has a configurable host interface that supports I3CSM, I²C, and SPI serial communication, features up to 2.25 Kbytes FIFO and 2 programmable interrupts with ultra-low-power wake-on-motion support to minimize system power consumption.

The ICM-42670-P supports the lowest gyro and accel sensor noise in this IMU class, and has the highest stability against temperature, shock (up to 20,000g) or SMT/bend induced offset as well as immunity against out-of-band vibration induced noise.

Other industry-leading features include on-chip APEX Motion Processing engine for gesture recognition, and pedometer, along with programmable digital filters, and an embedded temperature sensor.

The device supports a VDD operating range of 1.71V to 3.6V, and a separate VDDIO operating range from 1.71V to 3.6V.

ICM-42670-P FEATURES

- Low-Noise mode 6-axis current consumption of 0.55 mA
- Low-Power mode support for always-on experience
- Sleep Mode Current Consumption: 3.5µA
- User selectable Gyro Full-scale range (dps): ± 250/500/1000/2000
- User selectable Accelerometer Full-scale range (g): ± 2/4/8/16
- User-programmable digital filters for gyro, accel, and temp sensor
- APEX Motion Functions: Pedometer, Tilt Detection, Low-g Detection, Freefall Detection, Wake on Motion, Significant Motion Detection
- Host interface: 12.5 MHz I3CSM, 1 MHz I²C, 24 MHz SPI

APPLICATIONS

- Wearables (Fitness Bands, SmartWatches, Healthcare wearables)
- Hearables (True Wireless Headsets)
- Gaming Controllers
- Smart Home Appliances
- Smart TV remotes
- Drones
- Robotics
- Augmented Reality/Virtual Reality

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

This document is a product specification, providing a description, specifications, and design related information on the ICM-42670-P Single-Interface MotionTracking device. The device is housed in a small 2.5x3x0.76 mm 14-pin LGA package.

1.2 PRODUCT OVERVIEW

The ICM-42670-P is a 6-axis MotionTracking device that combines a 3-axis gyroscope and a 3-axis accelerometer in a small 2.5x3x0.76 mm (14-pin LGA) package. It also features up to 2.25 Kbytes FIFO that can lower the traffic on the serial bus interface and reduce power consumption by allowing the system processor to burst read sensor data and then go into a low-power mode. ICM-42670-P, with its 6-axis integration, enables manufacturers to eliminate the costly and complex selection, qualification, and system level integration of discrete devices, guaranteeing optimal motion performance for consumers.

The gyroscope supports four programmable full-scale range settings from ± 250 dps to ± 2000 dps and the accelerometer supports four programmable full-scale range settings from $\pm 2g$ to $\pm 16g$.

Other industry-leading features include on-chip 16-bit ADCs, programmable digital filters, an embedded temperature sensor, and programmable interrupts. The device features I3CSM, I²C, and SPI serial interfaces, a VDD operating range of 1.71V to 3.6V, and a separate VDDIO operating range of 1.71V to 3.6V.

The host interface can be configured to support I3CSM slave, I²C slave, or SPI slave modes. The I3CSM interface supports speeds up to 12.5 MHz (data rates up to 12.5 Mbps in SDR mode, 25 Mbps in DDR mode), the I²C interface supports speeds up to 1 MHz, and the SPI interface supports speeds up to 24 MHz.

The device provides high robustness by supporting 20,000g shock reliability.

1.3 APPLICATIONS

- Wearables (Fitness Bands, SmartWatches, Healthcare wearables)
- Hearables (True Wireless Headsets)
- Gaming Controllers
- Smart Home Appliances
- Smart TV remotes
- Drones
- Robotics
- Augmented Reality/Virtual Reality

2 FEATURES

2.1 GYROSCOPE FEATURES

The triple-axis MEMS gyroscope in the ICM-42670-P includes a wide range of features:

- Digital-output X-, Y-, and Z-axis angular rate sensors (gyroscopes) with programmable full-scale range of ± 250 , ± 500 , ± 1000 , and ± 2000 degrees/sec
- Low Noise (LN) power mode support
- Digitally programmable low-pass filters
- Factory calibrated sensitivity scale factor
- Self-test

2.2 ACCELEROMETER FEATURES

The triple-axis MEMS accelerometer in ICM-42670-P includes a wide range of features:

- Digital-output X-, Y-, and Z-axis accelerometer with programmable full-scale range of $\pm 2g$, $\pm 4g$, $\pm 8g$ and $\pm 16g$
- Low Noise (LN) and Low Power (LP) power modes support
- User-programmable interrupts
- Wake-on-motion interrupt for low power operation of applications processor
- Self-test

2.3 MOTION FEATURES

ICM-42670-P includes the following motion features, also known as APEX (**A**dvanced **P**edometer and **E**vent Detection – neXt gen)

- Pedometer: Tracks step count and issues a step detect Interrupt.
- Tilt Detection: Issues an interrupt when the Tilt angle exceeds 35 degrees for more than a programmable time.
- Low-g Detection: Triggers an interrupt when absolute value of accelerometer combined axis falls below a programmable threshold and stays below the threshold for a programmable time.
- Freefall Detection: Triggers an interrupt when device freefall is detected and outputs freefall duration.
- Wake on Motion (WoM): Detects motion when accelerometer samples exceed a programmable threshold. This motion event can be used to enable device operation from sleep mode.
- Significant Motion Detector (SMD): Detects significant motion based on accelerometer data.

2.4 ADDITIONAL FEATURES

ICM-42670-P includes the following additional features:

- Up to 2.25 Kbytes FIFO buffer enables the applications processor to read the data in bursts
- User-programmable digital filters for gyroscope, accelerometer, and temperature sensor
- 12.5M Hz I3CSM (data rates up to 12.5 Mbps in SDR mode, 25 Mbps in DDR mode) / 1 MHz I²C / 24 MHz SPI slave host interface
- Digital-output temperature sensor
- Smallest and thinnest LGA package for portable devices: 2.5x3x0.76 mm (14-pin LGA)
- 20,000g shock tolerant
- MEMS structure hermetically sealed and bonded at wafer level
- RoHS and Green compliant

3 ELECTRICAL CHARACTERISTICS

3.1 GYROSCOPE SPECIFICATIONS

Typical Operating Conditions, VDD = 1.8V, VDDIO = 1.8V, T_A=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
GYROSCOPE SENSITIVITY						
Full-Scale Range	GYRO_UI_FS_SEL=0		±2000		°/s	2
	GYRO_UI_FS_SEL=1		±1000		°/s	2
	GYRO_UI_FS_SEL=2		±500		°/s	2
	GYRO_UI_FS_SEL=3		±250		°/s	2
Gyroscope ADC Word Length	Output in two's complement format		16		bits	2, 5
Sensitivity Scale Factor	GYRO_UI_FS_SEL=0		16.4		LSB/(°/s)	2
	GYRO_UI_FS_SEL=1		32.8		LSB/(°/s)	2
	GYRO_UI_FS_SEL=2		65.5		LSB/(°/s)	2
	GYRO_UI_FS_SEL=3		131		LSB/(°/s)	2
Sensitivity Scale Factor Initial Tolerance	25°C		±1		%	1, 7
Sensitivity Scale Factor Variation Over Temperature	-40°C to +85°C; Board-Level		±0.007		%/°C	3, 6
Nonlinearity	Best fit straight line; 25°C; Board-Level		±0.1		%	3, 6
Cross-Axis Sensitivity	Board-level		±2		%	3, 6
ZERO-RATE OUTPUT (ZRO)						
Initial ZRO Tolerance	25°C		±1		°/s	1, 7
ZRO Variation vs. Temperature	-40°C to +85°C; Board-Level		±0.015		°/s/°C	3, 6
OTHER PARAMETERS						
Rate Noise Spectral Density	@ 10 Hz		0.007		°/s /VHz	1
Total RMS Noise	Bandwidth = 100 Hz		0.07		°/s-rms	4
Gyroscope Mechanical Frequencies		25	28	30	kHz	1
Low Pass Filter Response		16		180	Hz	2
Gyroscope Start-Up Time	Time from gyro enable to gyro drive ready		30		ms	3
Output Data Rate		12.5		1600	Hz	2

Table 1. Gyroscope Specifications

Notes:

1. Tested in production at component-level.
2. Guaranteed by design.
3. Derived from validation or characterization of parts, not tested in production.
4. Calculated from Rate Noise Spectral Density.
5. 20-bits data format supported in FIFO, see section 6.1.
6. Board-level spec values depend on specific board design. For design information of boards used for device characterization, that forms the basis of the spec values reported here, please contact your local TDK InvenSense FAE.
7. Value after factory test and trim.

3.2 ACCELEROMETER SPECIFICATIONS

Typical Operating Conditions, VDD = 1.8V, VDDIO = 1.8V, T_A=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
ACCELEROMETER SENSITIVITY						
Full-Scale Range	ACCEL_UI_FS_SEL=0		±16		g	2
	ACCEL_UI_FS_SEL=1		±8		g	2
	ACCEL_UI_FS_SEL=2		±4		g	2
	ACCEL_UI_FS_SEL=3		±2		g	2
ADC Word Length	Output in two's complement format		16		bits	2, 5
Sensitivity Scale Factor	ACCEL_UI_FS_SEL=0		2,048		LSB/g	2
	ACCEL_UI_FS_SEL=1		4,096		LSB/g	2
	ACCEL_UI_FS_SEL=2		8,192		LSB/g	2
	ACCEL_UI_FS_SEL=3		16,384		LSB/g	2
Sensitivity Scale Factor Initial Tolerance	25°C		±1		%	1, 7
Sensitivity Change vs. Temperature	-40°C to +85°C; Board-Level		±0.01		%/°C	3, 6
Nonlinearity	Best Fit Straight Line, ±2g; Board-Level		±0.1		%	3, 6
Cross-Axis Sensitivity	Board-level		±1		%	3, 6
ZERO-G OUTPUT						
Initial Tolerance	25°C		±25		mg	1, 7
Zero-G Level Change vs. Temperature	-40°C to +85°C; Board-Level		±0.15		mg/°C	3, 6
OTHER PARAMETERS						
Power Spectral Density	@ 10 Hz		100		μg/√Hz	1
RMS Noise	Bandwidth = 100 Hz		1.0		mg-rms	4
Low Pass Filter Response		16		180	Hz	2
Accelerometer Startup Time	From sleep mode to valid data		10		ms	3
Output Data Rate		1.5625		1600	Hz	2

Table 2. Accelerometer Specifications

Notes:

1. Tested in production at component-level.
2. Guaranteed by design.
3. Derived from validation or characterization of parts, not tested in production.
4. Calculated from Power Spectral Density.
5. 20-bits data format supported in FIFO, see section 6.1.
6. Board-level spec values depend on specific board design. For design information of boards used for device characterization, that forms the basis of the spec values reported here, please contact your local TDK InvenSense FAE.
7. Value after factory test and trim.

3.3 ELECTRICAL SPECIFICATIONS

3.3.1 D.C. Electrical Characteristics

Typical Operating Conditions, VDD = 1.8V, VDDIO = 1.8V, TA=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
SUPPLY VOLTAGES						
VDD		1.71	1.8	3.6	V	1
VDDIO		1.71	1.8	3.6	V	1
SUPPLY CURRENTS						
Low-Noise Mode	6-Axis Gyroscope + Accelerometer		0.55		mA	2
	3-Axis Accelerometer		0.20		mA	2
	3-Axis Gyroscope		0.42		mA	2
Full-Chip Sleep Mode	At 25°C		3.5		μA	2
TEMPERATURE RANGE						
Specified Temperature Range	Performance parameters are not applicable beyond Specified Temperature Range	-40		+85	°C	1

Table 3. D.C. Electrical Characteristics

Notes:

1. Guaranteed by design.
2. Derived from validation or characterization of parts, not tested in production.

3.3.2 A.C. Electrical Characteristics

Typical Operating Conditions, VDD = 1.8V, VDDIO = 1.8V, TA=25°C, unless otherwise noted.

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	NOTES
SUPPLIES						
Supply Ramp Time	Valid power-on RESET	0.1		3	ms	1
Power Supply Noise			10		mV peak-peak	1
TEMPERATURE SENSOR						
Operating Range	Ambient	-40		85	°C	1
25°C Output	Output in two's complement format		0		LSB	3
ADC Resolution			16		bits	2
ODR	With Filter	1.5625		1600	Hz	2, 4
Room Temperature Offset	25°C	-3		3	°C	3
Stabilization Time (fixed number of clock cycles)				0.64	sec	2
Sensitivity	Trimmed	125	126.9	129	LSB/°C	1
Sensitivity for FIFO data	Trimmed	1.95	1.983	2.01	LSB/°C	1
POWER-ON RESET						
Start-up time for register read/write	From power-up			1	ms	1
I²C ADDRESS

3.7 ABSOLUTE MAXIMUM RATINGS

Stresses above those listed as “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to the absolute maximum ratings conditions for extended periods may affect device reliability.

PARAMETER	RATING
Supply Voltage, VDD	-0.5V to 4V
Supply Voltage, VDDIO	-0.5V to 4V
Input Voltage Level (FSYNC, SCL, SDA)	-0.5V to VDDIO + 0.5 V
Acceleration (Any Axis, unpowered)	20,000g for 0.2 ms
Operating Temperature Range	-40°C to +85°C
Storage Temperature Range	-40°C to +125°C
Electrostatic Discharge (ESD) Protection	2 kV (HBM); 500V (CDM)
Latch-up	JEDEC Class II (2), 125°C ±100 mA

Table 8. Absolute Maximum Ratings

4 APPLICATIONS INFORMATION

4.1 PIN OUT DIAGRAM AND SIGNAL DESCRIPTION

PIN NUMBER	PIN NAME	PIN DESCRIPTION
1	AP_SDO / AP_AD0	AP_SDO: AP SPI serial data output (4-wire mode); AP_AD0: AP I3C SM / I ² C slave address LSB
2	RESV	No Connect or Connect to GND or Connect to VDDIO
3	RESV	No Connect or Connect to GND or Connect to VDDIO
4	INT1 / INT	INT1: Interrupt 1 (Note: INT1 can be push-pull or open drain) INT: All interrupts mapped to pin 4
5	VDDIO	IO power supply voltage
6	GND	Power supply ground
7	FSYNC	Frame sync input; Connect to GND if FSYNC not used
8	VDD	Power supply voltage
9	INT2	INT2: Interrupt 2 (Note: INT2 can be push-pull or open drain)
10	RESV	No Connect or Connect to GND or Connect to VDDIO
11	RESV	No Connect or Connect to GND or Connect to VDDIO
12	AP_CS	AP SPI Chip select (AP SPI interface); Connect to VDDIO if using AP I3C SM / I ² C interface
13	AP_SCL / AP_SCLK	AP_SCL: AP I3C SM / I ² C serial clock; AP_SCLK: AP SPI serial clock
14	AP_SDA / AP_SDIO / AP_SDI	AP_SDA: AP I3C SM / I ² C serial data; AP_SDIO: AP SPI serial data I/O (3-wire mode); AP_SDI: AP SPI serial data input (4-wire mode)

4.4 SYSTEM BLOCK DIAGRAM

Figure 7. ICM-42670-P System Block Diagram

Note: The above block diagram is an example. Please refer to the pin-out (section 4.1) for other configuration options.

4.5 OVERVIEW

The ICM-42670-P is comprised of the following key blocks and functions:

- Three-axis MEMS gyroscope
- Three-axis MEMS accelerometer
- I3CSM, I²C, and SPI serial communications interfaces to Host
- Self-Test
- Sensor Data Registers
- FIFO
- Interrupts
- Digital-Output Temperature Sensor
- Bias and LDOs
- Charge Pump
- Standard Power Modes

4.6 THREE-AXIS MEMS GYROSCOPE

The ICM-42670-P includes a vibratory MEMS rate gyroscope, which detects rotation about the X-, Y-, and Z- Axes. When the gyroscope is rotated about any of the sense axes, the Coriolis Effect causes a vibration that is detected by a capacitive pickoff. The resulting signal is amplified, demodulated, and filtered to produce a voltage that is proportional to the angular rate. This voltage is digitized using on-chip Analog-to-Digital Converter (ADC) to sample each axis. The full-scale range of the gyro sensor may be digitally programmed to ± 250 , ± 500 , ± 1000 , and ± 2000 degrees per second (dps).

4.7 THREE-AXIS MEMS ACCELEROMETER

The ICM-42670-P includes a 3-Axis MEMS accelerometer. Acceleration along a particular axis induces displacement of a proof mass in the MEMS structure, and capacitive sensors detect the displacement. The ICM-42670-P architecture reduces the accelerometers' susceptibility to fabrication variations as well as to thermal drift. When the device is placed on a flat surface, it will measure 0g on the X- and Y-axes and +1g on the Z-axis. The accelerometers' scale factor is calibrated at the factory and is nominally independent of supply voltage. The full-scale range of the digital output can be adjusted to $\pm 2g$, $\pm 4g$, $\pm 8g$ and $\pm 16g$.

4.8 I3CSM, I²C AND SPI HOST INTERFACE

The ICM-42670-P communicates to the application processor using an I3CSM, I²C, or SPI serial interface. The ICM-42670-P always acts as a slave when communicating to the application processor.

4.9 SELF-TEST

Self-test allows for the testing of the mechanical and electrical portions of the sensors. The self-test for each measurement axis can be activated by means of the gyroscope and accelerometer self-test registers. When the self-test is activated, the electronics cause the sensors to be actuated and produce an output signal. The output signal is used to observe the self-test response. The self-test response is defined as follows:

$$\text{SELF-TEST RESPONSE} = \text{SENSOR OUTPUT WITH SELF-TEST ENABLED} - \text{SENSOR OUTPUT WITH SELF-TEST DISABLED}$$

When the value of the self-test response is within the specified min/max limits, the part has passed self-test. When the self-test response exceeds the min/max values, the part is deemed to have failed self-test.

4.10 SENSOR DATA REGISTERS

The sensor data registers contain the latest gyroscope, accelerometer, and temperature measurement data. They are read-only registers and are accessed via the serial interface. Data from these registers may be read any time.

4.11 INTERRUPTS

Interrupt functionality is configured via the Interrupt Configuration register. Items that are configurable include the interrupt pins configuration, the interrupt latching and clearing method, and triggers for the interrupt. Items that can trigger an interrupt are (1) new data is available to be read (from the FIFO and Data registers); (2) accelerometer event interrupts; (3) FIFO watermark; (4) FIFO full. The interrupt status can be read from the Interrupt Status register.

4.12 DIGITAL-OUTPUT TEMPERATURE SENSOR

An on-chip temperature sensor and ADC are used to measure the ICM-42670-P die temperature. The readings from the ADC can be read from the FIFO or the Sensor Data registers.

Temperature sensor ODR is the higher value between gyroscope and accelerometer ODR.

4.13 BIAS AND LDOS

The bias and LDO section generate the internal supply and the reference voltages and currents required by the ICM-42670-P.

4.14 CHARGE PUMP

An on-chip charge pump generates the high voltage required for the MEMS oscillator.

4.15 STANDARD POWER MODES

The following table lists the user-accessible power modes for ICM-42670-P.

MODE	NAME	GYRO	ACCEL
1	Sleep Mode	Off	Off
2	Standby Mode	Drive On	Off
3	Accelerometer Low-Power Mode	Off	Duty-Cycled
4	Accelerometer Low-Noise Mode	Off	On
5	Gyroscope Low-Noise Mode	On	Off
6	6-Axis Low-Noise Mode	On	On

Table 11. Standard Power Modes for ICM-42670-P

5 SIGNAL PATH

The following figure shows a block diagram of the signal path for ICM-42670-P.

Figure 8. ICM-42670-P Signal Path

The signal path starts with ADCs for the gyroscope and accelerometer. Low-Noise Mode and Low-Power Mode options are available for the accelerometer and are selectable using register field `ACCEL_MODE`. Only Low-Noise Mode is available for gyroscope.

In Low-Noise Mode, the ADC output is sent through an Anti-Alias Filter (AAF). The AAF is a filter with fixed coefficients (not user configurable), also the AAF cannot be bypassed. The AAF is followed by a 1st Order Low Pass Filter (LPF) with user selectable filter bandwidth options using register fields `ACCEL_UI_FILT_BW` and `GYRO_UI_FILT_BW`.

In Low-Power Mode, the accelerometer ADC output is sent through an Average filter, with user configurable average filter setting using register field `ACCEL_UI_AVG`.

The output of 1st Order LPF in Low-Noise Mode, or Average filter in Low-Power Mode is subject to ODR selection, with user selectable ODR using register fields `GYRO_ODR` and `ACCEL_ODR`. This is followed by Full Scale Range (FSR) selection based on user configurable settings for register fields `GYRO_UI_FS_SEL` and `ACCEL_UI_FS_SEL`.

6 FIFO

The ICM-42670-P contains up to 2.25Kbyte FIFO register that is accessible via the serial interface. Shared SRAM is used for FIFO and APEX features. Default configuration of the device provides 1Kbyte FIFO and rest of the SRAM is used for APEX. User may disable APEX features to extend FIFO size to 2.25 Kbytes using register field APEX_DISABLE in register SENSOR_CONFIG3.

User can configure the FIFO Data Rate (FDR) to control the rate at which FIFO packets are written to the FIFO. Register field FDR_SEL in register FDR_CONFIG (register 0x66h in Bank MREG1) provides FDR control, based on settings for FIFO packet rate decimation factor. User must disable sensors when initializing FDR_SEL value or making changes to it.

6.1 PACKET STRUCTURE

Figure 9 shows the FIFO packet structures supported in ICM-42670-P. Base data format for gyroscope and accelerometer is 16-bits per element. 20-bits data format support is included in one of the packet structures. When 20-bits data format is used, gyroscope data consists of 19-bits of actual data and the LSB is always set to 0, accelerometer data consists of 18-bits of actual data and the two lowest order bits are always set to 0. When 20-bits data format is used, the only FSR settings that are operational are ± 2000 dps for gyroscope and $\pm 16g$ for accelerometer, even if the FSR selection register settings are configured for other FSR values. The corresponding sensitivity scale factor values are 131 LSB/dps for gyroscope and 8192 LSB/g for accelerometer.

Figure 9. FIFO Packet Structure

The rest of this sub-section describes how individual data is packaged in the different FIFO packet structures.

Packet 1: Individual data is packaged in Packet 1 as shown below.

BYTE	CONTENT
0x00	FIFO Header
0x01	Accel X [15:8]
0x02	Accel X [7:0]
0x03	Accel Y [15:8]
0x04	Accel Y [7:0]
0x05	Accel Z [15:8]
0x06	Accel Z [7:0]
0x07	Temperature[7:0]

Packet 2: Individual data is packaged in Packet 2 as shown below.

BYTE	CONTENT
0x00	FIFO Header
0x01	Gyro X [15:8]
0x02	Gyro X [7:0]
0x03	Gyro Y [15:8]
0x04	Gyro Y [7:0]
0x05	Gyro Z [15:8]
0x06	Gyro Z [7:0]
0x07	Temperature[7:0]

Packet 3: Individual data is packaged in Packet 3 as shown below.

BYTE	CONTENT
0x00	FIFO Header
0x01	Accel X [15:8]
0x02	Accel X [7:0]
0x03	Accel Y [15:8]
0x04	Accel Y [7:0]
0x05	Accel Z [15:8]
0x06	Accel Z [7:0]
0x07	Gyro X [15:8]
0x08	Gyro X [7:0]
0x09	Gyro Y [15:8]
0x0A	Gyro Y [7:0]
0x0B	Gyro Z [15:8]
0x0C	Gyro Z [7:0]
0x0D	Temperature[7:0]
0x0E	TimeStamp[15:8]
0x0F	TimeStamp[7:0]

Packet 4: Individual data is packaged in Packet 4 as shown below.

BYTE	CONTENT	
0x00	FIFO Header	
0x01	Accel X [19:12]	
0x02	Accel X [11:4]	
0x03	Accel Y [19:12]	
0x04	Accel Y [11:4]	
0x05	Accel Z [19:12]	
0x06	Accel Z [11:4]	
0x07	Gyro X [19:12]	
0x08	Gyro X [11:4]	
0x09	Gyro Y [19:12]	
0x0A	Gyro Y [11:4]	
0x0B	Gyro Z [19:12]	
0x0C	Gyro Z [11:4]	
0x0D	Temperature[15:8]	
0x0E	Temperature[7:0]	
0x0F	TimeStamp[15:8]	
0x10	TimeStamp[7:0]	
0x11	Accel X [3:0]	Gyro X [3:0]
0x12	Accel Y [3:0]	Gyro Y [3:0]
0x13	Accel Z [3:0]	Gyro Z [3:0]

6.2 FIFO HEADER

The following table shows the structure of the 1byte FIFO header.

BIT FIELD	ITEM	DESCRIPTION
7	HEADER_MSG	1: FIFO is empty 0: Packet contains sensor data
6	HEADER_ACCEL	1: Packet is sized so that accel data have location in the packet, FIFO_ACCEL_EN must be 1 0: Packet does not contain accel sample
5	HEADER_GYRO	1: Packet is sized so that gyro data have location in the packet, FIFO_GYRO_EN must be 1 0: Packet does not contain gyro sample
4	HEADER_20	1: Packet has a new and valid sample of extended 20-bit data for gyro and/or accel 0: Packet does not contain a new and valid extended 20-bit data
3:2	HEADER_TIMESTAMP_FSYNC	00: Packet does not contain timestamp or FSYNC time data 01: Reserved 10: Packet contains ODR Timestamp 11: Packet contains FSYNC time, and this packet is flagged as first ODR after FSYNC (only if FIFO_TMST_FSYNC_EN is 1)
1	HEADER_ODR_ACCEL	1: The ODR for accel is different for this accel data packet compared to the previous accel packet 0: The ODR for accel is the same as the previous packet with accel
0	HEADER_ODR_GYRO	1: The ODR for gyro is different for this gyro data packet compared to the previous gyro packet 0: The ODR for gyro is the same as the previous packet with gyro

Note at least HEADER_ACCEL or HEADER_GYRO must be set for a sensor data packet to be set.

6.3 MAXIMUM FIFO STORAGE

The maximum number of packets that can be stored in FIFO is a variable quantity depending on the use case. As shown in Figure 10, the physical FIFO size is 1 Kbytes or 2.25 Kbytes (depending on APEX_DISABLE setting as described above). A number of bytes equal to the packet size selected (see section 6.1) is reserved to prevent reading a packet during write operation. Additionally, a read cache 2 packets wide is available.

The total storage available is up to the maximum number of packets that can be accommodated in 1 Kbytes (or 2.25 Kbytes) plus 40 cache bytes. Note: the cache can hold 5 packets instead of 2 in the specific case when the packet size is 8bytes and the FIFO mode is Stop-on-full.

Figure 10. Maximum FIFO Storage

7 PROGRAMMABLE INTERRUPTS

The ICM-42670-P has a programmable interrupt system that can generate an interrupt signal on the INT pins. Status flags indicate the source of an interrupt. Interrupt sources may be enabled and disabled individually. There are two interrupt outputs. Any interrupt may be mapped to either interrupt pin as explained in the register section. The following configuration options are available for the interrupts

- INT1 and INT2 can be push-pull or open drain
- Level or pulse mode
- Active high or active low

Additionally, ICM-42670-P includes In-band Interrupt (IBI) support for the I3CSM interface.

8 APEX MOTION FUNCTIONS

The APEX (Advanced Pedometer and Event Detection – neXt gen) features of ICM-42670-P consist of:

- Pedometer: Tracks step count and issues a step detect Interrupt.
- Tilt Detection: Issues an interrupt when the Tilt angle exceeds 35 degrees for more than a programmable time.
- Low-g Detection: Triggers an interrupt when absolute value of accelerometer combined axis falls below a programmable threshold and stays below the threshold for a programmable time.
- Freefall Detection: Triggers an interrupt when device freefall is detected and outputs freefall duration.
- Wake on Motion (WoM): Detects motion when accelerometer samples exceed a programmable threshold. This motion event can be used to enable device operation from sleep mode.
- Significant Motion Detector (SMD): Detects significant motion based on accelerometer data.

Shared SRAM is used for FIFO and APEX features. Default configuration of the device provides 1Kbyte FIFO and rest of the SRAM is used for APEX. User may disable APEX features to extend FIFO size to 2.25 Kbytes using register field APEX_DISABLE in register SENSOR_CONFIG3.

9 DIGITAL INTERFACE

9.1 I3CSM, I²C AND SPI SERIAL INTERFACES

The internal registers and memory of the ICM-42670-P can be accessed using I3CSM at 12.5 MHz (data rates up to 12.5 Mbps in SDR mode, 25 Mbps in DDR mode), I²C at 1 MHz or SPI at 24 MHz. SPI operates in 3-wire or 4-wire mode. Pin assignments for serial interfaces are described in Section 4.1.

9.2 I3CSM INTERFACE

I3CSM is a new 2-wire digital interface comprised of the signals serial data (SDA) and serial clock (SCLK). I3CSM is intended to improve upon the I²C interface, while preserving backward compatibility. The I3CSM capability of this device is compliant with Version 1.0 of the MIPI Alliance Specification for I3CSM.

I3CSM carries the advantages of I²C in simplicity, low pin count, easy board design, and multi-drop (vs. point to point), but provides the higher data rates, simpler pads, and lower power of SPI. I3CSM adds higher throughput for a given frequency, in-band interrupts (from slave to master), dynamic addressing.

ICM-42670-P supports the following features of I3CSM:

- SDR data rate up to 12.5 Mbps
- DDR data rate up to 25 Mbps
- Dynamic address allocation
- In-band Interrupt (IBI) support
- Support for asynchronous timing control mode 0
- Error detection (CRC and/or Parity)
- Common Command Code (CCC)

The ICM-42670-P always operates as an I3CSM slave device when communicating to the system processor, which thus acts as the I3CSM master. I3CSM master controls an active pullup resistance on SDA, which it can enable and disable. The pullup resistance may be a board level resistor controlled by a pin, or it may be internal to the I3CSM master.

The following table shows I3CSM Common Command Code (CCC) commands supported by the device.

CCC Description		Required or Optional per I3C v1.0	Supported by ICM-42670-P
1	ENEC, broadcast mode. (Enable Events)	Required	Yes
2	DISEC, broadcast mode. (Disable Events)	Required	Yes
3	ENTAS0, broadcast mode. (Enter Activity State 0)	Required	Yes
4	ENTAS1, broadcast mode. (Enter Activity State 1)	Optional	No
5	ENTAS2, broadcast mode. (Enter Activity State 0)	Optional	No
6	ENTAS3, broadcast mode. (Enter Activity State 0)	Optional	No
7	RSTDAA, broadcast mode. (Reset dynamic address assignment)	Required	Yes
8	ENTDAA, broadcast mode. (Enter dynamic address assignment)	Required	Yes
9	DEFSLVS, broadcast mode. (Define list of slaves)	Optional	No
10	SETMWL, broadcast mode. (Set Max Write Length)	Required	Yes
11	SETMRL, broadcast mode. (Set Max Read Length)	Required	Yes
12	ENTTM, broadcast mode. (Enter Test Mode)	Optional	No
13	ENTHDR0, broadcast mode. (Enter HDR DDR mode)	Optional	Yes
14	ENTHDR1, broadcast mode. (Enter HDR TSP mode)	Optional	No
15	ENTHDR2, broadcast mode. (Enter HDR TSL mode)	Optional	No

16	SETXTIME, broadcast mode. (Exchange Timing Information)		
16.1	Defining byte = 0x7F (ST)	Optional	No
16.2	Defining byte = 0xBF (DT)	Optional	No
16.3	Defining byte = 0xDF (Enter Async Mode 0)	Optional	Yes
16.4	Defining byte = 0xEF (Enter Async Mode 1)	Optional	No
16.5	Defining byte = 0xF7 (Enter Async Mode 2)	Optional	No
16.6	Defining byte = 0xFB (Enter Async Mode 3)	Optional	No
16.7	Defining byte = 0xFD (Async Trigger for Async Mode 3)	Optional	No
16.8	Defining byte = 0x3F (TPH)	Optional	No
16.9	Defining byte = 0x9f (TU)	Optional	No
16.10	Defining byte = 0x8F (ODR)	Optional	No
16.11	Defining byte = 0xff (disable all timing control function)	Optional	Yes
17	ENEC, direct mode. (Enable Events)	Required	Yes
18	DISEC, direct mode. (Disable Events)	Required	Yes
19	ENTAS0, direct mode. (Enter Activity State 0)	Required	Yes
20	ENTAS1, direct mode. (Enter Activity State 1)	Optional	No
21	ENTAS2, direct mode. (Enter Activity State 2)	Optional	No
22	ENTAS3, direct mode. (Enter Activity State 3)	Optional	No
23	RSTDAA, direct mode. (Reset dynamic address assignment)	Required	Yes
24	SETDASA, direct mode. (Set Dynamic address from static address)	Optional	Yes
25	SETNEWDA, direct mode. (Set new dynamic address)	Required	Yes
26	SETMWL, direct mode. (Set Max Write Length)	Required	Yes
27	SETMRL, direct mode. (Set Max Read length)	Required	Yes
28	GETMWL, direct mode. (Get Max write length)	Required	Yes
29	GETMRL, direct mode. (Get Max Read length)	Required	Yes
30	GETPID, direct mode. (Get provisional ID)	Required	Yes
31	GETBCR, direct mode. (Get Bus Characteristics Register)	Required	Yes
32	GETDCR, direct mode. (Get Device Characteristics Register)	Required	Yes
33	GETSTATUS, direct mode. (Get Device Status)	Required	Yes
34	GETACCMST, direct mode. (Get Accept Mastership)	Optional	No
35	SETBRGTGT, direct mode. (Set Bridge Targets)	Optional	No
36	GETMXDS, direct mod. (Get Max Data Speed)	Optional	Yes
37	GETHDCAP, direct mode. (Get HDR capability)	Optional	Yes
38	SETXTIME, direct mode. (Set Exchange Timing information)		
38.1	Defining byte = 0x7F (ST)	Optional	No
38.2	Defining byte = 0xBF (DT)	Optional	No
38.3	Defining byte = 0xDF (Enter Async Mode 0)	Optional	Yes
38.4	Defining byte = 0xEF (Enter Async Mode 1)	Optional	No
38.5	Defining byte = 0xF7 (Enter Async Mode 2)	Optional	No
38.6	Defining byte = 0xFB (Enter Async Mode 3)	Optional	No
38.7	Defining byte = 0xFD (Async Trigger for Async Mode 3)	Optional	No

38.8	Defining byte = 0x3F (TPH)	Optional	No
38.9	Defining byte = 0x9f (TU)	Optional	No
38.10	Defining byte = 0x8F (ODR)	Optional	No
38.11	Defining byte = 0xff (disable all timing control function)	Optional	Yes
39	GETXTIME, direct mode. (Get Exchange Timing Information)	Optional	Yes

Table 12. I3CSM CCC Commands

9.3 I²C INTERFACE

I²C is a two-wire interface comprised of the signals serial data (SDA) and serial clock (SCL). In general, the lines are open-drain and bi-directional. In a generalized I²C interface implementation, attached devices can be a master or a slave. The master device puts the slave address on the bus, and the slave device with the matching address acknowledges the master.

The ICM-42670-P always operates as a slave device when communicating to the system processor, which thus acts as the master. SDA and SCL lines typically need pull-up resistors to VDDIO. The maximum bus speed is 1 MHz.

The slave address of the ICM-42670-P is b110100X, which is 7 bits long. The LSB bit of the 7-bit address is determined by the logic level on pin AP_AD0. This allows two ICM-42670-Ps to be connected to the same I²C bus. When used in this configuration, the address of one of the devices should be b1101000 (pin AP_AD0 is logic low) and the address of the other should be b1101001 (pin AP_AD0 is logic high).

9.4 I²C COMMUNICATIONS PROTOCOL

START (S) and STOP (P) Conditions

Communication on the I²C bus starts when the master puts the START condition (S) on the bus, which is defined as a HIGH-to-LOW transition of the SDA line while SCL line is HIGH (see figure below). The bus is considered to be busy until the master puts a STOP condition (P) on the bus, which is defined as a LOW to HIGH transition on the SDA line while SCL is HIGH (see Figure 11).

Additionally, the bus remains busy if a repeated START (Sr) is generated instead of a STOP condition.

Figure 11. START and STOP Conditions

Data Format / Acknowledge

I²C data bytes are defined to be 8-bits long. There is no restriction to the number of bytes transmitted per data transfer. Each byte transferred must be followed by an acknowledge (ACK) signal. The clock for the acknowledge signal is generated by the master, while the receiver generates the actual acknowledge signal by pulling down SDA and holding it low during the HIGH portion of the acknowledge clock pulse.

If a slave is busy and cannot transmit or receive another byte of data until some other task has been performed, it can hold SCL LOW, thus forcing the master into a wait state. Normal data transfer resumes when the slave is ready and releases the clock line (refer to Figure 12).

Figure 12. Acknowledge on the I²C Bus

Communications

After beginning communications with the START condition (S), the master sends a 7-bit slave address followed by an 8th bit, the read/write bit. The read/write bit indicates whether the master is receiving data from or is writing to the slave device. Then, the master releases the SDA line and waits for the acknowledge signal (ACK) from the slave device. Each byte transferred must be followed by an acknowledge bit. To acknowledge, the slave device pulls the SDA line LOW and keeps it LOW for the high period of the SCL line. Data transmission is always terminated by the master with a STOP condition (P), thus freeing the communications line. However, the master can generate a repeated START condition (Sr), and address another slave without first generating a STOP condition (P). A LOW to HIGH transition on the SDA line while SCL is HIGH defines the stop condition. All SDA changes should take place when SCL is low, with the exception of start and stop conditions.

Figure 13. Complete I²C Data Transfer

To write the internal ICM-42670-P registers, the master transmits the start condition (S), followed by the I²C address and the write bit (0). At the 9th clock cycle (when the clock is high), the ICM-42670-P acknowledges the transfer. Then the master puts the register address (RA) on the bus. After the ICM-42670-P acknowledges the reception of the register address, the master puts the register data onto the bus. This is followed by the ACK signal, and data transfer may be concluded by the stop condition (P). To write multiple bytes after the last ACK signal, the master can continue outputting data rather than transmitting a stop signal. In this case, the ICM-42670-P automatically increments the register address and loads the data to the appropriate register. The following figures show single and two-byte write sequences.

Single-Byte Write Sequence

Master	S	AD+W		RA		DATA		P
Slave			ACK		ACK		ACK	

Burst Write Sequence

Master	S	AD+W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

To read the internal ICM-42670-P registers, the master sends a start condition, followed by the I²C address and a write bit, and then the register address that is going to be read. Upon receiving the ACK signal from the ICM-42670-P, the master transmits a start signal followed by the slave address and read bit. As a result, the ICM-42670-P sends an ACK signal and the data. The communication ends with a not acknowledge (NACK) signal and a stop bit from master. The NACK condition is defined such that the SDA line remains high at the 9th clock cycle. The following figures show single and two-byte read sequences.

Single-Byte Read Sequence

Master	S	AD+W		RA		S	AD+R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Burst Read Sequence

Master	S	AD+W		RA		S	AD+R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA		

9.5 I²C TERMS

SIGNAL	DESCRIPTION
S	Start Condition: SDA goes from high to low while SCL is high
AD	Slave I ² C address
W	Write bit (0)
R	Read bit (1)
ACK	Acknowledge: SDA line is low while the SCL line is high at the 9 th clock cycle
NACK	Not-Acknowledge: SDA line stays high at the 9 th clock cycle
RA	ICM-42670-P internal register address
DATA	Transmit or received data
P	Stop condition: SDA going from low to high while SCL is high

Table 13. I²C Terms

9.6 SPI INTERFACE

The ICM-42670-P supports 3-wire or 4-wire SPI for the host interface. The ICM-42670-P always operates as a Slave device during standard Master-Slave SPI operation.

With respect to the Master, the Serial Clock output (SCLK), the Serial Data Output (SDO), the Serial Data Input (SDI), and the Serial Data IO (SDIO) are shared among the Slave devices. Each SPI slave device requires its own Chip Select (CS) line from the master.

CS goes low (active) at the start of transmission and goes back high (inactive) at the end. Only one CS line is active at a time, ensuring that only one slave is selected at any given time. The CS lines of the non-selected slave devices are held high, causing their SDO lines to remain in a high-impedance (high-z) state so that they do not interfere with any active devices.

SPI Operational Features

1. Data is delivered MSB first and LSB last
2. Data is latched on the rising edge of SCLK
3. Data should be transitioned on the falling edge of SCLK
4. The maximum frequency of SCLK is 24 MHz
5. SPI read and write operations are completed in 16 or more clock cycles (two or more bytes). The first byte contains the Register Address, and the following byte(s) contain(s) the SPI data. The first bit of the first byte contains the Read/Write bit and indicates the Read (1) operation. The following 7 bits contain the Register Address. In cases of multiple-byte Reads, data is two or more bytes:

Register Address format

MSB							LSB
R/W	A6	A5	A4	A3	A2	A1	A0

SPI Data format

MSB							LSB
D7	D6	D5	D4	D3	D2	D1	D0

6. Supports Single or Burst Read/Writes.

11 PART NUMBER PACKAGE MARKING

The part number package marking for ICM-42670-P devices is summarized below:

PART NUMBER	PART NUMBER PACKAGE MARKING
ICM-42670-P	I460P

12 USE NOTES

12.1 GYROSCOPE POWER ON TO POWER OFF TRANSITION

After powering the gyroscope off, a period of > 20ms should be allowed to elapse before it is powered back on.

13 ACCESSING MREG1, MREG2 AND MREG3 REGISTERS

The following procedure must be used to access registers in user banks MREG1, MREG2, and MREG3.

MREG1, MREG2, and MREG3 registers are accessed indirectly, using the following registers in Bank 0 (_W registers for Write, _R registers for Read)

- BLK_SEL_W
- MADDR_W
- M_W
- BLK_SEL_R
- MADDR_R
- M_R

For MREG1 write access, BLK_SEL_W must be set to 0x00. For MREG2 write access, BLK_SEL_W must be set to 0x28. For MREG3 write access, BLK_SEL_W must be set to 0x50.

For MREG1 read access, BLK_SEL_R must be set to 0x00. For MREG2 read access, BLK_SEL_R must be set to 0x28. For MREG3 read access, BLK_SEL_R must be set to 0x50.

User must ensure BLK_SEL_W and BLK_SEL_R are set to 0x00 after completing MREG1, MREG2, or MREG3 access.

Example: To write a value to an MREG1 register at address 0x14 use the following steps:

- BLK_SEL_W must be set to 0
- MADDR_W must be set to 0x14 (address of the MREG1 register being accessed)
- M_W must be set to the desired value
- Wait for 10 μ s

Example: To read the value of an MREG1 register at address 0x14 use the following steps:

- BLK_SEL_R must be set to 0
- MADDR_R must be set to 0x14 (address of the MREG1 register being accessed)
- Wait for 10 μ s
- Read register M_R to access the value in MREG1 register 0x14
- Wait for 10 μ s

Host must not access any other register for 10 μ s once MREG1, MREG2 or MREG3 access is kicked off.

Additionally, please note the following for MREG1, MREG2 or MREG3 register accesses:

- User must check that register field MCLK_RDY is at value 1, to confirm that internal clock is running before initiating MREG register access.
- MREG1, MREG2, or MREG3 read and write operations cannot happen in all power modes. Sleep mode, and Accelerometer low power mode with WUOSC do not support MREG1, MREG2 or MREG3 access. When in sleep mode or accelerometer LP mode with WUOSC, MREG1, MREG2 or MREG3 read/write operations require the user to power on the RC oscillator using register field IDLE from register PWR_MGMT0.
- It can take up to 10 μ s for MREG1, MREG2 or MREG3 read/write operations to be effective. No register access must be performed during this period
- Multiple serial protocol transactions are needed for a single data byte transfer, please refer to the examples provided.
- Data transfers through indirect access are only supported for single byte transfers and burst data transfer is not supported for read or write operations.

14 REGISTER MAP

This section lists the register map for the ICM-42670-P, for user banks 0, MREG1, MREG2 and MREG3.

14.1 USER BANK 0 REGISTER MAP

ADDR (HEX)	ADDR (DEC)	REGISTER NAME	SERIAL I/F	BIT7	BIT6	BIT5	BIT4	BIT3	BIT2	BIT1	BIT0

Detailed register descriptions are provided in the sections that follow.

Register fields marked as Reserved must not be modified by the user. The Reset Value of the register can be used to determine the default value of reserved register fields, and unless otherwise noted this default value must be maintained even if the values of other register fields are modified by the user.

In the sections that follow, some register fields are described as can be changed on-the-fly even if sensor is on. These are the only register fields that can be changed on-the-fly even if sensor is on. Register fields not described as such must not be changed on-the-fly if sensor is on.

15 USER BANK 0 REGISTER MAP – DESCRIPTIONS

This section describes the function and contents of each register within user bank 0.

Note: The device powers up in sleep mode.

15.1 MCLK_RDY

Name: MCLK_RDY Address: 00 (00h) Serial IF: R Reset value: 0x00 at power-up, changes to 0x01 after OTP load is completed		
BIT	NAME	FUNCTION
7:4	-	Reserved
3	MCLK_RDY	0: Indicates internal clock is currently not running 1: Indicates internal clock is currently running
2:0	-	Reserved

15.2 DEVICE_CONFIG

Name: DEVICE_CONFIG Address: 01 (01h) Serial IF: R/W Reset value: 0x04		
BIT	NAME	FUNCTION
7:3	-	Reserved

BIT	NAME	FUNCTION
7:0	TEMP_DATA[15:8]	Upper byte of temperature data

15.9 TEMP_DATA0

Name: TEMP_DATA0 Address: 10 (0Ah) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	TEMP_DATA[7:0]	Lower byte of temperature data

Temperature data value from the sensor data registers can be converted to degrees centigrade by using the following formula:

- Temperature in Degrees Centigrade = $(TEMP_DATA / 128) + 25$

Temperature data stored in FIFO can be an 8-bit or 16-bit quantity, depending on packet format. It can be converted to degrees centigrade by using the following formulas:

- 8-bit quantity: Temperature in Degrees Centigrade = $(TEMP_DATA / 2) + 25$; where TEMP_DATA refers to the 8 MSBs of the 16-bit word coming from the temperature sensor. In this mode the 8 LSBs are set to '0'.
- 16-bit quantity: Temperature in Degrees Centigrade = $(TEMP_DATA / 128) + 25$

15.42 FIFO_LOST_PKT0

Name: FIFO_LOST_PKT0 Address: 47 (2Fh) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	FIFO_LOST_PKT_CNT[7:0]	Low byte, number of packets lost in the FIFO

15.43 FIFO_LOST_PKT1

Name: FIFO_LOST_PKT1 Address: 48 (30h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	FIFO_LOST_PKT_CNT[15:8]	High byte, number of packets lost in the FIFO

15.44 APEX_DATA0

Name: APEX_DATA0 Address: 49 (31h) Serial IF: SYNCR Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	STEP_CNT[7:0]	Pedometer Output: Lower byte of Step Count measured by pedometer

15.45 APEX_DATA1

Name: APEX_DATA1 Address: 50 (32h) Serial IF: SYNCR Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	STEP_CNT[15:8]	Pedometer Output: Upper byte of Step Count measured by pedometer

15.46 APEX_DATA2

Name: APEX_DATA2 Address: 51 (33h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	STEP_CADENCE	Pedometer Output: Walk/run cadency in number of samples. Format is u6.2. e.g. At 50 Hz ODR and 2 Hz walk frequency, the cadency is 25 samples and the register will output 100.

15.47 APEX_DATA3

Name: APEX_DATA3 Address: 52 (34h) Serial IF: R Reset value: 0x04		
BIT	NAME	FUNCTION
7:3	-	Reserved
2	DMP_IDLE	0: Indicates DMP is running 1: Indicates DMP is idle
1:0	ACTIVITY_CLASS	Pedometer Output: Detected activity 00: Unknown 01: Walk 10: Run 11: Reserved

Name: INTF_CONFIG0 Address: 53 (35h) Serial IF: R/W Reset value: 0x30		
BIT	NAME	FUNCTION
7	-	Reserved
6	FIFO_COUNT_FORMAT	0: FIFO count is reported in bytes 1: FIFO count is reported in records (1 record = 16 bytes for header + gyro + accel + temp sensor data + time stamp, or 8 bytes for header + gyro/accel + temp sensor data)
5	FIFO_COUNT_ENDIAN	This bit applies to FIFO Count and Lost Packet Count 0: Reported in Little Endian format 1: Reported in Big Endian format
4	SENSOR_DATA_ENDIAN	0: Sensor data is reported in Little Endian format 1: Sensor data is reported in Big Endian format
3:0	-	Reserved

15.49 INTF_CONFIG1

Name: INTF_CONFIG1 Address: 54 (36h) Serial IF: R/W Reset value: 0x4D		
BIT	NAME	FUNCTION
7:4	-	Reserved
3	I3C_SDR_EN	0: I3C SM SDR mode not enabled 1: I3C SM SDR mode enabled Device will be in pure I ² C mode if {I3C_SDR_EN, I3C_DDR_EN} = 00
2	I3C_DDR_EN	0: I3C SM DDR mode not enabled 1: I3C SM DDR mode enabled This bit will not take effect unless I3C_SDR_EN = 1.
1:0	CLKSEL	00: Always select internal RC oscillator 01: Select PLL when available, else select RC oscillator (default) 10: Reserved 11: Disable all clocks

15.50 INT_STATUS_DRDY

Name: INT_STATUS_DRDY Address: 57 (39h) Serial IF: R/C Reset value: 0x00		
BIT	NAME	FUNCTION
7:1	-	Reserved
0	DATA_RDY_INT	This bit automatically sets to 1 when a Data Ready interrupt is generated. The bit clears to 0 after the register has been read.

15.51 INT_STATUS

Name: INT_STATUS Address: 58 (3Ah) Serial IF: R/C Reset value: 0x10		
BIT	NAME	FUNCTION
7	ST_INT	This bit automatically sets to 1 when a Self Test done interrupt is generated. The bit clears to 0 after the register has been read.
6	FSYNC_INT	This bit automatically sets to 1 when an FSYNC interrupt is generated. The bit clears to 0 after the register has been read.
5	PLL_RDY_INT	This bit automatically sets to 1 when a PLL Ready interrupt is generated. The bit clears to 0 after the register has been read.
4	RESET_DONE_INT	This bit automatically sets to 1 when software reset is complete. The bit clears to 0 after the register has been read.
3	-	Reserved
2	FIFO_THS_INT	This bit automatically sets to 1 when the FIFO buffer reaches the threshold value. The bit clears to 0 after the register has been read.
1	FIFO_FULL_INT	This bit automatically sets to 1 when the FIFO buffer is full. The bit clears to 0 after the register has been read.
0	AGC_RDY_INT	This bit automatically sets to 1 when an AGC Ready interrupt is generated. The bit clears to 0 after the register has been read.

15.52 INT_STATUS2

Name: INT_STATUS2 Address: 59 (3Bh) Serial IF: R/C Reset value: 0x00		
BIT	NAME	FUNCTION
7:4	-	Reserved
3	SMD_INT	Significant Motion Detection Interrupt, clears on read
2	WOM_X_INT	Wake on Motion Interrupt on X-axis, clears on read
1	WOM_Y_INT	Wake on Motion Interrupt on Y-axis, clears on read
0	WOM_Z_INT	Wake on Motion Interrupt on Z-axis, clears on read

15.53 INT_STATUS3

Name: INT_STATUS3 Address: 60 (3Ch) Serial IF: R/C Reset value: 0x00		
BIT	NAME	FUNCTION
7:6	-	Reserved
5	STEP_DET_INT	Step Detection Interrupt, clears on read
4	STEP_CNT_OVF_INT	Step Count Overflow Interrupt, clears on read
3	TILT_DET_INT	Tilt Detection Interrupt, clears on read
2	FF_DET_INT	Freefall Interrupt, clears on read
1	LOWG_DET_INT	LowG Interrupt, clears on read
0	-	Reserved

15.54 FIFO_COUNTH

Name: FIFO_COUNTH Address: 61 (3Dh) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	FIFO_COUNT[15:8]	High Bits, count indicates the number of records or bytes available in FIFO according to FIFO_COUNT_FORMAT setting. Note: Must read FIFO_COUNTL to latch new data for both FIFO_COUNTH and FIFO_COUNTL.

15.55 FIFO_COUNTL

Name: FIFO_COUNTL Address: 62 (3Eh) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	FIFO_COUNT[7:0]	Low Bits, count indicates the number of records or bytes available in FIFO according to FIFO_COUNT_REC setting. Reading this byte latches the data for both FIFO_COUNTH, and FIFO_COUNTL.

15.56 FIFO_DATA

Name: FIFO_DATA Address: 63 (3Fh) Serial IF: R Reset value: 0xFF		
BIT	NAME	FUNCTION
7:0	FIFO_DATA	FIFO data port

15.57 WHO_AM_I

Name: WHO_AM_I Address: 117 (75h) Serial IF: R Reset value: 0x67		
BIT	NAME	FUNCTION
7:0	WHOAMI	Register to indicate to user which device is being accessed

Description:

This register is used to verify the identity of the device. The contents of WHOAMI is an 8-bit device ID. The default value of the register is 0x67. This is different from the I²C address of the device as seen on the slave I²C controller by the applications processor.

15.58 BLK_SEL_W

Name: BLK_SEL_W Address: 121 (79h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	BLK_SEL_W	Block address for accessing MREG1 or MREG2 register space for register write operation

15.59 MADDR_W

Name: MADDR_W Address: 122 (7Ah) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	MADDR_W	To write to a register in MREG1 or MREG2 space, set this register field to the address of the register in MREG1 or MREG2 space.

15.60 M_W

Name: M_W Address: 123 (7Bh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	M_W	To write a value to a register in MREG1 or MREG2 space, that value must be written to M_W.

15.61 BLK_SEL_R

Name: BLK_SEL_R Address: 124 (7Ch) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	BLK_SEL_R	Block address for accessing MREG1 or MREG2 register space for register read operation

15.62 MADDR_R

Name: MADDR_R Address: 125 (7Dh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	MADDR_R	To read the value of a register in MREG1 or MREG2 space, set this register field to the address of the register in MREG1 or MREG2 space.

15.63 M_R

Name: M_R Address: 126 (7Eh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	M_R	To read the value of a register in MREG1 or MREG2 space, that value is accessed from M_R.

16 USER BANK MREG1 REGISTER MAP – DESCRIPTIONS

This section describes the function and contents of each register within user bank MREG1. The procedure for accessing MREG1 registers is described in section 12.

16.1 TMST_CONFIG1

Name: TMST_CONFIG1 Address: 00 (00h) Serial IF: R/W Reset value: 0x02		
BIT	NAME	FUNCTION
7:5	-	Reserved
4	TMST_ON_SREG_EN	0: TMST_FSYNCH and TMST_FSYNCL registers report the delta time from FSYNC to next ODR 1: TMST_FSYNCH and TMST_FSYNCL registers report: absolute timestamp when FSYNC even is not present; delta time from FSYNC to next ODR when FSYNC event is present
3	TMST_RES	Time Stamp resolution: When set to 0 (default), time stamp resolution is 1 μ s. When set to 1, resolution is 16 μ s
2	TMST_DELTA_EN	Time Stamp delta enable: When set to 1, the time stamp field contains the measurement of time since the last occurrence of ODR.
1	TMST_FSYNC_EN	Time Stamp register FSYNC enable (default). When set to 1, the contents of the Timestamp feature of FSYNC is enabled. The user also needs to select FIFO_TMST_FSYNC_EN in order to propagate the timestamp value to the FIFO.
0	TMST_EN	0: Time Stamp register disable 1: Time Stamp register enable

16.2 FIFO_CONFIG5

Name: FIFO_CONFIG5 Address: 01 (01h) Serial IF: R/W Reset value: 0x20		
BIT	NAME	FUNCTION
7:6	-	Reserved
5	FIFO_WM_GT_TH	0: Trigger FIFO Watermark interrupt when FIFO_COUNT = FIFO_WM 1: Trigger FIFO Watermark interrupt on every ODR if FIFO_COUNT = FIFO_WM
4	FIFO_RESUME_PARTIAL_RD	0: FIFO is read in packets. If a partial packet is read, then the subsequent read will start from the beginning of the un-read packet. 1: FIFO can be read partially. When read is resumed, FIFO bytes will continue from last read point. The SW driver is responsible for cascading previous read and present read and for maintaining frame boundaries.
3	FIFO_HIRES_EN	0: 20-bit resolution not enabled in the FIFO packet readout 1: 20-bit resolution enabled in the FIFO packet readout
2	FIFO_TMST_FSYNC_EN	0: TMST in the FIFO cannot be replaced by the FSYNC timestamp 1: Allows the TMST in the FIFO to be replaced by the FSYNC timestamp
1	FIFO_GYRO_EN	0: Gyro packets not enabled to go to FIFO 1: Enables Gyro packets to go to FIFO
0	FIFO_ACCEL_EN	0: Accel packets not enabled to go to FIFO 1: Enables Accel packets to go to FIFO

16.3 FIFO_CONFIG6

Name: FIFO_CONFIG6 Address: 02 (02h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:5	-	Reserved
4	FIFO_EMPTY_INDICATOR_DIS	0: 0xFF is sent out as FIFO data when FIFO is empty. 1: The last FIFO data is sent out when FIFO is empty.
3:1	-	Reserved
0	RCOSC_REQ_ON_FIFO_THS_DIS	0: When the FIFO is operating in ALP+WUOSC mode and the watermark (WM) interrupt is enabled, the FIFO wakes up the system oscillator (RCOSC) as soon as the watermark level is reached. The system oscillator remains enabled until a Host FIFO read operation happens. This will temporarily cause a small increase in the power consumption due to the enabling of the system oscillator. 1: The system oscillator is not automatically woken-up by the FIFO/INT when the WM interrupt is triggered. The side effect is that the host can receive invalid packets until the system oscillator is off after it has been turned on for other reasons not related to a WM interrupt. The recommended setting of this bit is '1' before entering and during all power modes excluding ALP with WUOSC. This is in order to avoid having to do a FIFO access/flush before entering sleep mode. During ALP with WUOSC it is recommended to set this bit to '0'. It is recommended to reset this bit back to '1' before exiting ALP+WUOSC with a wait time of 1 ODR or higher.

16.4 FSYNC_CONFIG

Name: FSYNC_CONFIG Address: 03 (03h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7	-	Reserved
6:4	FSYNC_UI_SEL	000: Do not tag FSYNC flag 001: Tag FSYNC flag to TEMP_OUT LSB 010: Tag FSYNC flag to GYRO_XOUT LSB 011: Tag FSYNC flag to GYRO_YOUT LSB 100: Tag FSYNC flag to GYRO_ZOUT LSB 101: Tag FSYNC flag to ACCEL_XOUT LSB 110: Tag FSYNC flag to ACCEL_YOUT LSB 111: Tag FSYNC flag to ACCEL_ZOUT LSB
3:2	-	Reserved
1	FSYNC_UI_FLAG_CLEAR_SEL	0: FSYNC flag is cleared when UI sensor register is updated 1: FSYNC flag is cleared when UI interface reads the sensor register LSB of FSYNC tagged axis
0	FSYNC_POLARITY	0: Start from Rising edge of FSYNC pulse to measure FSYNC interval 1: Start from Falling edge of FSYNC pulse to measure FSYNC interval

16.5 INT_CONFIG0

Name: INT_CONFIG0 Address: 04 (04h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:6	-	Reserved
5:4	UI_DRDY_INT_CLEAR	Data Ready Interrupt Clear Option (latched mode) 00: Clear on Status Bit Read 01: Clear on Status Bit Read 10: Clear on Sensor Register Read 11: Clear on Status Bit Read OR on Sensor Register read
3:2	FIFO_THS_INT_CLEAR	FIFO Threshold Interrupt Clear Option (latched mode) 00: Clear on Status Bit Read 01: Clear on Status Bit Read 10: Clear on FIFO data 1Byte Read 11: Clear on Status Bit Read OR on FIFO data 1 byte read
1:0	FIFO_FULL_INT_CLEAR	FIFO Full Interrupt Clear Option (latched mode) 00: Clear on Status Bit Read 01: Clear on Status Bit Read 10: Clear on FIFO data 1Byte Read 11: Clear on Status Bit Read OR on FIFO data 1 byte read

16.6 INT_CONFIG1

Name: INT_CONFIG1 Address: 05 (05h) Serial IF: R/W Reset value: 0x10		
BIT	NAME	FUNCTION
7	-	Reserved
6	INT_TPULSE_DURATION	Interrupt pulse duration 0: Interrupt pulse duration is 100 μ s 1: Interrupt pulse duration is 8 μ s
5	-	Reserved
4	INT_ASYNC_RESET	0: The interrupt pulse is reset as soon as the interrupt status register is read if the pulse is still active. 1: The interrupt pulse remains high for the intended duration independent of when the interrupt status register is read. This is the default and recommended setting. In this case, when in ALP with the WUOSC clock, the clearing of the interrupt status register requires up to one ODR period after reading.
3:0	-	Reserved

16.7 SENSOR_CONFIG3

Name: SENSOR_CONFIG3 Address: 06 (06h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7	-	Reserved
6	APEX_DISABLE	1: Disable APEX features to extend FIFO size to 2.25 Kbytes
5:0	-	Reserved

16.8 ST_CONFIG

Name: ST_CONFIG Address: 19 (13h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7	-	Reserved
6	ST_NUMBER_SAMPLE	This bit selects the number of sensor samples that should be used to process self-test 0: 16 samples 1: 200 samples
5:3	ACCEL_ST_LIM	These bits control the tolerated ratio between self-test processed values and reference (fused) ones for accelerometer 000 to 110: Reserved 111: 50%
2:0	GYRO_ST_LIM	These bits control the tolerated ratio between self-test processed values and reference (fused) ones for gyroscope 000 to 110: Reserved 111: 50%

16.9 SELFTEST

Name: SELFTEST Address: 20 (14h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7	GYRO_ST_EN	1: Enable gyro self-test operation. Host needs to program this bit to 0 to move device out of self-test mode. If host programs this bit to 0 while ST_BUSY = 1 and ST_DONE = 0, the current running self-test operation is terminated by host.
6	ACCEL_ST_EN	1: Enable accel self-test operation. Host needs to program this bit to 0 to move device out of self-test mode. If host programs this bit to 0 while ST_BUSY = 1 and ST_DONE = 0, the current running self-test operation is terminated by host.
5:0	-	Reserved

High values increase step count accuracy but increase latency. 0000: 0 steps 0001: 1 step 0010: 2 steps 0011: 3 steps 0100: 4 steps 0101: 5 steps (default) 0110: 6 steps 0111: 7 steps 1000: 8 steps 1001: 9 steps 1010: 10 steps 1011: 11 steps 1100: 12 steps 1101: 13 steps 1110: 14 steps 1111: 15 steps

16.21 APEX_CONFIG4

Name: APEX_CONFIG4 Address: 70 (46h) Serial IF: R/W Reset value: 0x51		
BIT	NAME	FUNCTION
7:5	PED_STEP_DET_TH_SEL	Minimum number of steps that must be detected before step event is signaled. Low values reduce latency but increase false positives. High values increase step event validity but increase latency. 000: 0 steps 001: 1 step 010: 2 steps (default) 011: 3 steps 100: 4 steps 101: 5 steps 110: 6 steps 111: 7 steps
4:2	PED_SB_TIMER_TH_SEL	Duration before algorithm considers that user has stopped taking steps. 000: 50 samples 001: 75 sample 010: 100 samples 011: 125 samples 100: 150 samples (default) 101: 175 samples 110: 200 samples 111: 225 samples
1:0	PED_HI_EN_TH_SEL	Threshold to classify acceleration signal as motion not due to steps. High values improve vibration rejection. Low values improve detection. 00: 87.89 mg 01: 104.49 mg (default) 10: 132.81 mg 11: 155.27 mg

16.22 APEX_CONFIG5

Name: APEX_CONFIG5 Address: 71 (47h) Serial IF: R/W Reset value: 0x80		
BIT	NAME	FUNCTION
7:6	TILT_WAIT_TIME_SEL	Minimum duration for which the device should be tilted before signaling event. 00: 0s 01: 2s 10: 4s (default) 11: 6s
5:3	LOWG_PEAK_TH_HYST_SEL	Hysteresis value added to the low-g threshold after exceeding it. 000: 31 mg (default) 001: 63 mg 010: 94 mg 011: 125 mg 100: 156 mg 101: 188 mg 110: 219 mg 111: 250 mg
2:0	HIGHG_PEAK_TH_HYST_SEL	Hysteresis value subtracted from the high-g threshold after exceeding it. 000: 31 mg (default) 001: 63 mg 010: 94 mg 011: 125 mg 100: 156 mg 101: 188 mg 110: 219 mg 111: 250 mg

16.23 APEX_CONFIG9

Name: APEX_CONFIG9 Address: 72 (48h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:4	FF_DEBOUNCE_DURATION_SEL	Period after a freefall is signaled during which a new freefall will not be detected. Prevents false detection due to bounces. 0000: 0 ms 0001: 1250 ms 0010: 1375 ms 0011: 1500 ms 0100: 1625 ms 0101: 1750 ms 0110: 1875 ms 0111: 2000 ms 1000: 2125 ms (default) 1001: 2250 ms 1010: 2375 ms 1011: 2500 ms 1100: 2625 ms 1101: 2750 ms 1110: 2875 ms 1111: 3000 ms
3:1	SMD_SENSITIVITY_SEL	Parameter to tune SMD algorithm robustness to rejection, ranging from 0 to 4 (values higher than 4 are reserved). Low values increase detection rate but increase false positives. High values reduce false positives but reduce detection rate (especially for transport use cases). Default value is 0.
0	SENSITIVITY_MODE	Pedometer sensitivity mode 0: Normal (default) 1: Slow walk Slow walk mode improves slow walk detection (<1 Hz) but the number of false positives may increase.

16.24 APEX_CONFIG10

Name: APEX_CONFIG10
Address: 73 (49h)
Serial IF: R/W
Reset value: 0x00

BIT	NAME	FUNCTION
7:3	LOWG_PEAK_TH_SEL	Threshold for accel values below which low-g state is detected. 00000: 31 mg (default) 00001: 63 mg 00010: 94 mg 00011: 125 mg 00100: 156 mg 00101: 188 mg 00110: 219 mg 00111: 250 mg 01000: 281 mg 01001: 313 mg 01010: 344 mg 01011: 375 mg 01100: 406 mg 01101: 438 mg 01110: 469 mg 01111: 500 mg 10000: 531 mg 10001: 563 mg 10010: 594 mg 10011: 625 mg 10100: 656 mg 10101: 688 mg 10110: 719 mg 10111: 750 mg 11000: 781 mg 11001: 813 mg 11010: 844 mg 11011: 875 mg 11100: 906 mg 11101: 938 mg 11110: 969 mg 11111: 1000 mg
2:0	LOWG_TIME_TH_SEL	Number of samples required to enter low-g state. 000: 1 sample (default) 001: 2 samples 010: 3 samples 011: 4 samples 100: 5 samples 101: 6 samples 110: 7 samples 111: 8 samples

16.25 APEX_CONFIG11

Name: APEX_CONFIG11
Address: 74 (4Ah)
Serial IF: R/W
Reset value: 0x00

BIT	NAME	FUNCTION
7:3	HIGHG_PEAK_TH_SEL	Threshold for accel values above which high-g state is detected. 00000: 250 mg (default) 00001: 500 mg 00010: 750 mg 00011: 1000 mg 00100: 1250 mg 00101: 1500 mg 00110: 1750 mg 00111: 2000 mg 01000: 2250 mg 01001: 2500 mg 01010: 2750 mg 01011: 3000 mg 01100: 3250 mg 01101: 3500 mg 01110: 3750 mg 01111: 4000 mg 10000: 4250 mg 10001: 4500 mg 10010: 4750 mg 10011: 5000 mg 10100: 5250 mg 10101: 5500 mg 10110: 5750 mg 10111: 6000 mg 11000: 6250 mg 11001: 6500 mg 11010: 6750 mg 11011: 7000 mg 11100: 7250 mg 11101: 7500 mg 11110: 7750 mg 11111: 8000 mg
2:0	HIGHG_TIME_TH_SEL	Number of samples required to enter high-g state. 000: 1 sample (default) 001: 2 samples 010: 3 samples 011: 4 samples 100: 5 samples 101: 6 samples 110: 7 samples 111: 8 samples

16.26 ACCEL_WOM_X_THR

Name: ACCEL_WOM_X_THR Address: 75 (4Bh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	WOM_X_TH	Threshold value for the Wake on Motion Interrupt for X-axis accelerometer WoM thresholds are expressed in fixed “mg” independent of the selected Range [0g : 1g]; Resolution 1g/256=~3.9 mg

16.27 ACCEL_WOM_Y_THR

Name: ACCEL_WOM_Y_THR Address: 76 (4Ch) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	WOM_Y_TH	Threshold value for the Wake on Motion Interrupt for Y-axis accelerometer WoM thresholds are expressed in fixed “mg” independent of the selected Range [0g : 1g]; Resolution 1g/256=~3.9 mg

16.28 ACCEL_WOM_Z_THR

Name: ACCEL_WOM_Z_THR Address: 77 (4Dh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	WOM_Z_TH	Threshold value for the Wake on Motion Interrupt for Z-axis accelerometer WoM thresholds are expressed in fixed “mg” independent of the selected Range [0g : 1g]; Resolution 1g/256=~3.9 mg

16.29 OFFSET_USER0

Name: OFFSET_USER0 Address: 78 (4Eh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	GYRO_X_OFFUSER[7:0]	Lower bits of X-gyro offset programmed by user. Max value is ±64 dps, resolution is 1/32 dps.

16.30 OFFSET_USER1

Name: OFFSET_USER1 Address: 79 (4Fh) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:4	GYRO_Y_OFFUSER[11:8]	Upper bits of Y-gyro offset programmed by user. Max value is ± 64 dps, resolution is 1/32 dps.
3:0	GYRO_X_OFFUSER[11:8]	Upper bits of X-gyro offset programmed by user. Max value is ± 64 dps, resolution is 1/32 dps.

16.31 OFFSET_USER2

Name: OFFSET_USER2 Address: 80 (50h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	GYRO_Y_OFFUSER[7:0]	Lower bits of Y-gyro offset programmed by user. Max value is ± 64 dps, resolution is 1/32 dps.

16.32 OFFSET_USER3

Name: OFFSET_USER3 Address: 81 (51h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	GYRO_Z_OFFUSER[7:0]	Lower bits of Z-gyro offset programmed by user. Max value is ± 64 dps, resolution is 1/32 dps.

16.33 OFFSET_USER4

Name: OFFSET_USER4 Address: 82 (52h) Serial IF: R/W Reset value: 0x00 Clock Domain: SCLK_UI		
BIT	NAME	FUNCTION
7:4	ACCEL_X_OFFUSER[11:8]	Upper bits of X-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.
3:0	GYRO_Z_OFFUSER[11:8]	Upper bits of Z-gyro offset programmed by user. Max value is ± 64 dps, resolution is 1/32 dps.

16.34 OFFSET_USER5

Name: OFFSET_USER5 Address: 83 (53h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	ACCEL_X_OFFUSER[7:0]	Lower bits of X-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.

16.35 OFFSET_USER6

Name: OFFSET_USER6 Address: 84 (54h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	ACCEL_Y_OFFUSER[7:0]	Lower bits of Y-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.

16.36 OFFSET_USER7

Name: OFFSET_USER7 Address: 85 (55h) Serial IF: R/W Reset value: 0x00 Clock Domain: SCLK_UI		
BIT	NAME	FUNCTION
7:4	ACCEL_Z_OFFUSER[11:8]	Upper bits of Z-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.
3:0	ACCEL_Y_OFFUSER[11:8]	Upper bits of Y-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.

16.37 OFFSET_USER8

Name: OFFSET_USER8 Address: 86 (56h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	ACCEL_Z_OFFUSER[7:0]	Lower bits of Z-accel offset programmed by user. Max value is $\pm 1g$, resolution is 0.5 mg.

16.38 ST_STATUS1

Name: ST_STATUS1 Address: 99 (63h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:6	-	Reserved
5	ACCEL_ST_PASS	1: Accel self-test passed for all the 3 axes
4	ACCEL_ST_DONE	1: Accel self-test done for all the 3 axes
3	AZ_ST_PASS	1: Accel Z-axis self-test passed
2	AY_ST_PASS	1: Accel Y-axis self-test passed
1	AX_ST_PASS	1: Accel X-axis self-test passed
0	-	Reserved

16.39 ST_STATUS2

Name: ST_STATUS2 Address: 100 (64h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7	-	Reserved
6	ST_INCOMPLETE	1: Self-test is incomplete. This bit is set to 1 if the self-test was aborted. One possible cause of aborting the self-test may be the detection of significant movement in the gyro when the self-test for gyro and/or accel is being executed.
5	GYRO_ST_PASS	1: Gyro self-test passed for all the 3 axes
4	GYRO_ST_DONE	1: Gyro self-test done for all the 3 axes
3	GZ_ST_PASS	1: Gyro Z-axis self-test passed
2	GY_ST_PASS	1: Gyro Y-axis self-test passed
1	GX_ST_PASS	1: Gyro X-axis self-test passed
0	-	Reserved

16.40 FDR_CONFIG

Name: FDR_CONFIG Address: 102 (66h) Serial IF: R/W Reset value: 0x00		
BIT	NAME	FUNCTION
7:4	-	Reserved
3:0	FDR_SEL	FIFO packet rate decimation factor. Sets the number of discarded FIFO packets. User must disable sensors when initializing FDR_SEL value or making changes to it. 0xxx: Decimation is disabled, all packets are sent to FIFO 1000: 1 packet out of 2 is sent to FIFO 1001: 1 packet out of 4 is sent to FIFO 1010: 1 packet out of 8 is sent to FIFO 1011: 1 packet out of 16 is sent to FIFO 1100: 1 packet out of 32 is sent to FIFO 1101: 1 packet out of 64 is sent to FIFO 1110: 1 packet out of 128 is sent to FIFO 1111: 1 packet out of 256 is sent to FIFO

16.41 APEX_CONFIG12

Name: APEX_CONFIG12
Address: 103 (67h)
Serial IF: R/W
Reset value: 0x00

BIT	NAME	FUNCTION
7:4	FF_MAX_DURATION_SEL	Maximum freefall length. Longer freefalls are ignored. 0000: 102 cm (default) 0001: 120 cm 0010: 139 cm 0011: 159 cm 0100: 181 cm 0101: 204 cm 0110: 228 cm 0111: 254 cm 1000: 281 cm 1001: 310 cm 1010: 339 cm 1011: 371 cm 1100: 403 cm 1101: 438 cm 1110: 473 cm 1111: 510 cm
3:0	FF_MIN_DURATION_SEL	Minimum freefall length. Shorter freefalls are ignored. 0000: 10 cm (default) 0001: 12 cm 0010: 13 cm 0011: 16 cm 0100: 18 cm 0101: 20 cm 0110: 23 cm 0111: 25 cm 1000: 28 cm 1001: 31 cm 1010: 34 cm 1011: 38 cm 1100: 41 cm 1101: 45 cm 1110: 48 cm 1111: 52 cm

17 USER BANK MREG2 REGISTER MAP – DESCRIPTIONS

This section describes the function and contents of each register within user bank MREG2. The procedure for accessing MREG2 registers is described in section 12.

17.1 OTP_CTRL7

Name: OTP_CTRL7 Address: 06 (06h) Serial IF: RWS Reset value: 0x06 (initial reset value is 0x0C, it changes to 0x06 after OTP load completes)		
BIT	NAME	FUNCTION
7:4	-	Reserved
3	OTP_RELOAD	Setting this bit to 1 triggers OTP copy operation.
2	-	Reserved
1	OTP_PWR_DOWN	0: Power up OTP to copy from OTP to SRAM 1: Power down OTP This bit is automatically set to 1 when OTP copy operation is complete.
0	-	Reserved

18 USER BANK MREG3 REGISTER MAP – DESCRIPTIONS

This section describes the function and contents of each register within user bank MREG3. The procedure for accessing MREG3 registers is described in section 12.

18.1 XA_ST_DATA

Name: XA_ST_DATA Address: 00 (00h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	XA_ST_DATA	Accel X-axis factory trimmed self-test response.

18.2 YA_ST_DATA

Name: YA_ST_DATA Address: 01 (01h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	YA_ST_DATA	Accel Y-axis factory trimmed self-test response.

18.3 ZA_ST_DATA

Name: ZA_ST_DATA Address: 02 (02h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	ZA_ST_DATA	Accel Z-axis factory trimmed self-test response.

18.4 XG_ST_DATA

Name: XG_ST_DATA Address: 03 (03h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	XG_ST_DATA	Gyro X-axis factory trimmed self-test response.

18.5 YG_ST_DATA

Name: YG_ST_DATA Address: 04 (04h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	YG_ST_DATA	Gyro Y-axis factory trimmed self-test response.

18.6 ZG_ST_DATA

Name: ZG_ST_DATA Address: 05 (05h) Serial IF: R Reset value: 0x00		
BIT	NAME	FUNCTION
7:0	ZG_ST_DATA	Gyro Z-axis factory trimmed self-test response.

19 SMARTMOTION PRODUCT FAMILY

ICM-42670-P is a member of the SmartMotion™ family of MEMS motion sensors with 1-, 2-, 3-, 6-, 7-, and 9-axis IMU platforms addressing the emerging need of many mass-market consumer applications via improved performance, accuracy, and intuitive motion and gesture-based interfaces.

For more information, please visit invensense.tdk.com.
