

Industries & Applications

Features & Benefits

- ▶ **AC or DC operation** enables use in a wide range of applications.
- ▶ **130% boost power capability** increases design flexibility and enable system retrofits.
- ▶ **Efficiencies of up to 92%** contribute to minimised energy consumption and an environmentally friendly energy footprint.
- ▶ **A peak inrush energy less than 0.6A²s** prevents input circuit breakers from nuisance tripping.
- ▶ **Push-in terminals** for tool-less installation and high vibration resistance.
- ▶ **Dedicated models with coated PCBs** to withstand harsh environments.
- ▶ **A sophisticated thermal design** for minimal installation clearances.

Add-ons and accessories

DBM buffer modules

In order to secure process uptime and reliability in 24V low-voltage systems, DBM buffer modules increase hold-up time or provide a reserve for peak loads.

DBM20

20A input/output, electrolytic capacitors, signalling & control, screw terminals

DBM20/E

20A input/output, electrolytic capacitors, signalling & control, spring clamp terminals

DDA DC/DC converter

Non-isolated step-down converter for creating additional DC bus voltages from a single DC input source.

DDA250

Single output 20A at 3.3..15V, input 9..53V, DC OK LED, screw terminals

DDA325

Dual output 14A at 3.3..24V and 8A at -3.3..-24V, input 9..40V, DC OK LEDs, screw terminals

DDA500

Dual output 2x20A at 3.3..15V, input 9..53V, DC OK LEDs, screw terminals

List of abbreviations

avg.	<i>average</i>	The arithmetic average calculated from a row of values.
CC		Constant output current
CGD		Corner grounded delta (AC power system)
chap.		Chapter
Dir.		Directive
eCap		Electrolytic capacitor
EMC		Electromagnetic Compatibility
Iac		AC input current under a particular operating condition
Iout		DC output current under a particular operating condition
Iout_boost		Available current reserve beyond Iout_nom (w/o a drop in Uset) that can be delivered for a limited time.
Iout_nom		Continuous nominal DC output current under STC.
Iout_ol		Max. intermittent DC output current in an overload situation and a shortfall of Uset.
Iout_sc		Max. short circuit DC output current and Uout close to zero.
ITU		International Telecommunication Union
max.	<i>maximum</i>	The maximum value which a parameter can assume, or which must not be exceeded.
MCB		Miniature circuit breaker
min.	<i>minimum</i>	The minimum value which a parameter can assume, or must not be fallen below.
MOV		Metal Oxide Varistor
MTBF		Mean Time Between Failure
nom.	<i>nominal</i>	The ideal or reference value of a technical parameter which is guaranteed under STC. All nominal values in this document refer to each other and represent the general specification of the device.
OCP		Overcurrent protection
OTP		Overtemperature protection
OVP		Overvoltage protection
PCB		Printed Circuit Board
PELV		Protective Extra Low Voltage
PE		Protective Earth
PFC		Power Factor Correction
Pout		Output power under a particular operating condition with reference to Pout_nom
Pout_boost		Available power reserve beyond Pout_nom that can be delivered for a limited time.
Pout_nom		Nominal output power
PSU		Power supply unit
Reg.		Regulation
SELV		Safety Extra Low Voltage
STC		Standard test conditions (see „1. General“ on page 6)
typ.	<i>typical</i>	The typical value of a parameter is not guaranteed but can be assumed under STC. The min. or max. value must be determined during the engineering process of the end application.
Uout		DC output voltage under a particular operating condition
Uout_nom		Nominal DC output voltage
Uset		Manually set output voltage via voltage potentiometer
UVP		Undervoltage protection
Vac		AC input voltage under a particular operating condition
Vac_nom		Nominal AC input voltage
/		Separator between two values. The conditions to which the values refer can be found in the last column of the table.
..		Specifies a range of values.
<		The parameter is less than or equal to the specified value
>		The parameter is greater than or equal to the specified value

X. Technical category

Technical parameter	Characteristic (optional)	Values	Condition (optional)
---------------------	---------------------------	--------	----------------------

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (77°F) ambient temperature and a run-in time of 5 minutes.

1. General

Proper handling of the product

The faultless and safe operation of the products requires proper transport, proper storage, set-up, assembly, installation, commissioning, operation and maintenance. The permissible ambient conditions must be observed. Instructions in the associated documentation must be observed.

Protection enclosure required

The device must be installed in a protective housing or control cabinet to which only qualified personnel have access.

Humid environments

Do not operate the device in a damp environment or in an environment where condensation is likely to occur.

Switch or circuit-breaker mounting position

A switch or circuit-breaker must be mounted near the equipment.

Observe country-specific regulations

In addition to the product documentation, the relevant country-specific regulations for the installation of the device must be observed.

Prohibited electrical/mechanical modifications

The product must not be modified in any way electrically or mechanically. Modifications can result in fatal injuries and damage to property.

Expiry of the manufacturer's warranty

The power supply is maintenance-free. Repairs can only be carried out by the manufacturer. Opening the housing voids the manufacturer's warranty.

Use of third-party products

If third-party products and components are used for power or voltage increase, buffering (primary or secondary side), EMC filtering, redundancy or for load protection, it must be approved by TDK-Lambda.

Standard test conditions

Unless otherwise stated, all values are specified in normal mounting position, at full load, nominal input and output voltages, 25°C (131°F) ambient temperature and a run-in time of 5 minutes.

7. Reliability and Service lifetime

The service lifetime of the power supply is determined primarily by the electrolytic capacitors utilised. The values provided herein are calculated estimates, and as such, do not represent guaranteed lifetimes. The calculation is based on the respective capacitor manufacturer's method, taking into account ripple current, operating frequency, and capacitor temperature under the herein specified operating conditions. It is important to note that, due to the theoretical nature of the calculation, all capacitor manufacturers specify a maximum expected service lifetime of 15 years.

TDK-Lambda applies strict component selection criteria and utilises electrolytic capacitors exclusively from reputable manufacturers such as Murata, Nippon Chemi-Con, Nichicon, Rubycon, and TDK.

14.4 HIPOT test

Apart from routine and type test, the end user might need to check the insulation strength during the final inspection and testing to guarantee the electrical safety of the end application. Therefore, a high-voltage test (HIPOT test) can be performed in the field. The following conditions must be observed:

- ▶ As every HIPOT test causes stress on the power supplies safety insulation, avoid frequent HIPOT testing or excessive test voltages
- ▶ The test voltages and durations, as indicated under „14.2 Insulation strength“ on page 18, must not be exceeded
- ▶ The test voltages rise and fall time should be between 2 and 4 seconds

i According to EN 60204-1 (Safety of machinery - Electrical equipment of machines), an individual HIPOT test of the power supply isn't required. During the HIPOT test of the end application, the power supply can be disconnected and only installed once the test has been completed.

² Exceeds the requirements of the European Low Voltage Directive 2014/35/EU

³ Except for the ITU broadcast frequency bands 47..68MHz, where the level shall be 3V.

Performance level definitions:

Criterion A:

The device continues operation as intended during and after the test. The specified performance level accepts a change of $\pm 10\%$ on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended.

Criterion B:

The device continues operation as intended after the test. The specified performance level accepts a change of $\pm 10\%$ on nominal output voltage and current. There is neither a violation of the performance level, nor a loss of function if the device is used as intended. During the test a violation of the performance level is allowed.

Criterion C:

A temporary loss of function is allowed, provided the function is auto-recoverable, or can be restored by the operation of the controls.

19. Compliance & Registration

Conformity with health, safety, and environmental protection standards for products sold within the European Economic Area (EEA).

UKCA (UK Conformity Assessed) is the product marking that is used for certain goods being placed on the United Kingdom market.

The Waste Electrical and Electronic Equipment Directive (WEEE Directive) is the European Community Directive 2012/19/EU on collection, recycling and recovery targets for all types of electrical goods.

The Restriction of Hazardous Substances Directive 2011/65/EU (RoHS 2) regulates the use of certain hazardous substances in electrical and electronic equipment.

Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH) is a European Union regulation that addresses the production and use of chemical substances, and their potential impacts on both human health and the environment.

20. Application notes

20.1 Parallel operation

The power supplies do not offer a parallel mode for load sharing. Paralleling power supplies to increase power is not recommended.

A 1+1 redundant system can be built by connecting the power supplies in parallel using a decoupling module. The products in the TDK-Lambda DRM series are recommended for this purpose. (refer to chapter "Add-ons and accessories" on page 3)

The following measures must be taken into account when setting up a 1+1 redundant system:

- ▶ Only power supplies of the same series and power rating must be paralleled
- ▶ Load wiring shall be identical in terms of length and cross section
- ▶ The output voltage of the power supplies must be set to the same value
- ▶ The output voltage of each power supply should be checked and maintained in regular intervals
- ▶ All power supplies must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above 55°C_{amb} (131°F_{amb}), mounting orientations others than the normal mounting position, etc.)
- ▶ The increased installation distances must be taken into account when installing the power supplies side by side (see "Installation clearances" on page 15)

 In parallel operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.

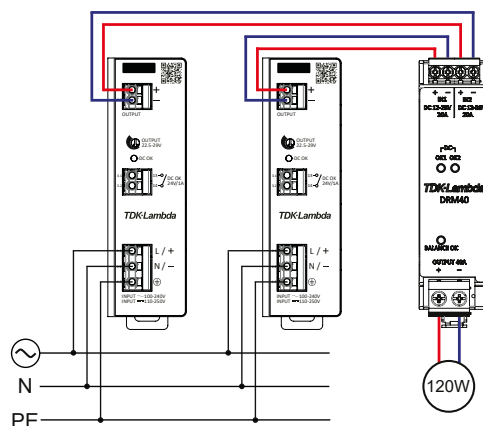

Fig. 26: Connection scheme of power supplies in parallel for the purpose of a 1+1 redundancy

20.2 Series operation

In order to increase the output voltage, it is possible to connect the power supplies in series. The following measures must be taken into account:

- ▶ The output voltage sum must not exceed 250V_{DC}
- ▶ If the output voltage sum exceeds 60V_{DC}, a safeguard against unintended touching must be considered
- ▶ Only power supplies of the same series and power rating must be connected in series
- ▶ All power supplies in series must be operated under the same ambient conditions
- ▶ The power supplies must not be operated under any condition which requires a power derating (e.g. altitudes above 3000mASL (9842ftASL), temperatures above 55°C_{amb} (131°F_{amb}), mounting orientations others than the normal mounting position, etc.)
- ▶ The increased installation clearances must be considered (refer to chapter "Installation clearances" on page 15)

 In series operations the values of output load regulation, inrush currents, EMI, harmonic and leakage currents will increase.
