EMC RECOMMENDED CIRCUIT

1. To ensure optimal performance, external capacitors C1 and C2 should be installed based on the product’s use environment. These capacitors must be positioned as close as possible to the product’s pin ends.
2. Refer to Table 1 for the recommended capacitance values of C1 and C2, which can be adjusted as required. Both low-ESR tantalum and electrolytic capacitors are suitable for use.
3. Hot swapping is not supported by this product, and its output terminal cannot be connected in parallel.
4. To further minimize output ripple, an “LC” filter network can be added to the output. The recommended inductance value (L) ranges from 10 μH to 47 μH.

Table 2

Recommended external circuit components	
FUSE	choose according to actual input current
C0 / C3	330 μF/ 50 V
LDM1	82 μH
C4	see Table 1
C1 / C2	10 μF / 50 V
LDM2	22 μH

Notes: For EMC tests we use Part ① in Fig. 3 for immunity and part ② for emissions test. Selecting based on needs.
