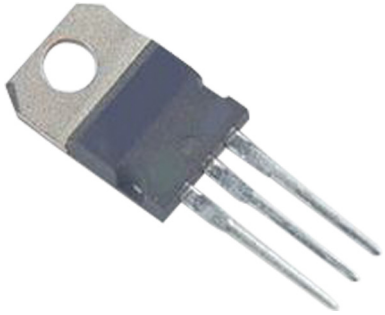
Darlington Transistor

multicomp PRO



Features:

- Collector-Emitter sustaining voltage-
  $V_{CEO(sus)}$ = 80V (Min.) - BDX33B, BDX34B
  = 100V (Minimum) - BDX33C, BDX34C
- Monolithic construction with Built-in Base-Emitter shunt resistor

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown safe operating area curves indicate I_C-V_{CE} limits of the transistor that must be observed for reliable operation i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure - 2 is based on $T_{J(PK)}$ = 150°C; TC is variable depending on conditions. Second breakdown pulse limits are valid for duty cycles to 10% provided $T_{J(PK)}$ <150°C. At high case temperatures, thermal limitation will reduce the power that can handled to values less than the limitations imposed by second breakdown.
